teamblue

In this guide, we will go through the steps needed to activate our VPS server with Plesk and manage the required CMS, either WooCommerce or PrestaShop.

First, you need to log in to your user area via the following link: https://controlpanel.nominalia.com/welcome.html Once inside your control panel, you will activate the server.

Then indicate the alias for it:

Once the server alias has been configured, you will be able to access the control panel, where you can view the monitoring panel. This panel will provide information on CPU usage, network speed and disk speed.

	¿Está seguro de que desea instalar: Plesk Debian 12 ?		

Once installed, you will receive an email telling you how to access Plesk. To do so, you must enter the IP address assigned to the server and the specified port.

Acceso via cPanel: IP:2087 Acceso via Plesk: IP:8443

*Important: It is accessed without "https://" and you must select the advanced settings to access the Plesk control panel.

You will then have the option to add your own domain or use a temporary domain in:

Añadiendo dominio nuevo	
En el Portal de servicios puede registrar un non Seleccionar su nombre de domin	nbre de dominio nuevo. nio
Nombre de dominio registrado Ya he registrado un nombre de dominio	Nombre de dominio temporal Todavía no he registrado ningún nombre de dominio
Nombre de dominio registrado * www. domain.name ~ Configuración del espacio we	eb
Añadir dominio Cancelar	

When adding the domain, you will need to update the "A" record in the domain's DNS with the current provider. This will allow you to display the website content.

SSL Certificate

At Plesk, we have the default option to install the Let's Encrypt certificate. To do this, go to the "Security" section and select "SSL/TLS Certificates". Once inside, choose "Install a free basic certificate".

Installing Applications

Under "Development Tools", select "Applications" to install WordPress, WooCommerce or PrestaShop. To install WordPress, under "Applications", select "Install" in:

Applications		
Manage My Applications	My Apps	
Manage apps installed on your websites. Featured Applications	The list below contains information about all installed apps. The None value in the Installation path column mean cannot be installed on any of your websites; it only provides a link to an external service.	s

	💈 Scan	
All Available Applications View and install free and	No items.	
commercial apps on your websites. Apps packaged in APS format only require several clicks to be installed on your websites.	Select an application to install from one of our featured applications or browse through all available applications.	

To install WooCommerce, from the option "All available applications", access Plugins and search for the CMS you want to install by keyword, for example, WooCommerce. Then, click on "Install now".

Plugins and Themes

reverent-chaplygin.136-144-254-103.plesk.page

Plugins Themes	Wood	ommerce	×Q
Upload Plugin *.zip WooCommerce ★★★★\$: (4224) ↓ 292+ million(s) ☆ Automattic	Everything you need to launch an online st and keep it growing for years. From your fi millions in revenue, Woo is with you.	ore in days rst sale to Details (1) 6.3	Compatible with my version of WordPress (6.4.2)

To install the PrestaShop CMS, you would follow the same process. From the "All applications" section, you would look for PrestaShop:

When installing it, the following error will be displayed:

Applications >	
Installation of	Prestashop
• Error: Unable to install the	app because its installation requirements are not met. Contact your hosting provider to resolve this problem.
Requirements	
PHP version	The app requires PHP version later than 7.1 but earlier than 7.4.999. Your PHP is 8.2.15. If PHP is not available, ensure that the PHP support is selected for the domain.
PHP limits	The PHP memory limit is 128M bytes. The app requires at least 256M bytes.
Back to application list	
* Required fields	Cancel

×

Due to the lack of compatibility of Plesk with Prestashop version 8.0, which requires PHP 8.1 or higher, you need to take measures to solve this problem. To do so, you will need to take the following steps:

- 1. Go to: Tools and settings -> Updates -> Add/Remove components.
- 2. Expand "Web Hosting" and then "PHP interpreter versions".
- 3. Select version 7.4 and continue with the installation.

Install and Update Plesk Summary Updates source and installation settings	p <u>l</u> esk
Install or Update Product Install a new product or update an existing one to a new version	Update Components Update the components for which there are available updates
Products summary:	
Plesk Obsidian Version 18.0.58	
■ ✓ • Web hosting (14 of 17 selected)	
 ProFTPD 	
Vebalizer	
 AWStats 	
V + ModSecurity	
Phusion Passenger server	
 Ruby support (install) 	
V - Nodejs support	
 Tools required for building kudy gems (install) 	
PHP interpreter versions (3 of 6 selected)	
PHP 8.3 (install)	
PHP 8.2	
PHP 8.1	
× - PHP 8.0 (outdated) (remove)	
PHP 7.4 (outdated) (remove)	
× - PHP from OS vendor	

Once the modification has been made, go to the development tools, specifically "Dev tools", and select the "PHP" option.

Other options that can be accessed under "PHP Settings":

- Option to increase script execution time (max_execution_time = 3600)
- Option to increase the maximum allowable file upload size (upload_max_filesize = 64M)

Task Scheduling

To schedule and automate tasks, such as running an hourly script or a specific PHP file, go to the "Scheduled tasks" option.

When accessing this section, the "Schedule a task" option is displayed, where you can configure the option you want.

Finally, the VPS server contracted with Nominalia includes an automated backup service which is performed twice a day. These backup copies can be easily restored from the Nominalia control panel with one click. To access this function, simply go to the "disk" section and then select "backups". By restoring them, the complete content of the server will be recovered. It is important to note that backups are stored for a maximum period of 48 hours.
